

## ABSTRACT

5       An elastic laminate capable of being rolled for storage and unwound from a roll  
when needed for use, includes an elastic layer selected from the group consisting of an  
array of continuous filament strands, an array of continuous filament strands with  
meltblown deposited on the continuous filament strands, and a film; a gatherable facing  
layer bonded to only one side of the elastic layer; and either an adhesive that  
demonstrates a relatively short open time deposited between the elastic layer and facing  
10    layer, or such adhesive and a postbonding adhesive or nonblocking agent, or a  
nonblocking agent layer deposited on the elastic layer on a side opposite to the facing  
layer.
